# What is Server Push?

Part of HTTP/2: an update to HTTP/1.1 meant to improve performance

Normal HTTP Requests

Server Push

# Introduction

- Goal: Understand how Server Push impacts performance
  - Focus on mobile, where it's more useful
- What should be pushed?
- What is the impact of factors that affect performance:
  - Device type
  - Network type and conditions
  - Webpage structure
- What is the impact on energy?

## Related work

- Performance of SPDY complex, dependent on network conditions<sup>1</sup>
  - Looked at Server Push briefly
- SPDY has inconsistent benefits on cellular networks<sup>2</sup>
- Server Push doesn't work well with caching<sup>3</sup>
- HTTP/2 usage is small but growing; shows benefits in the wild<sup>4</sup>

Motivates a deeper look at Server Push performance

# Methodology

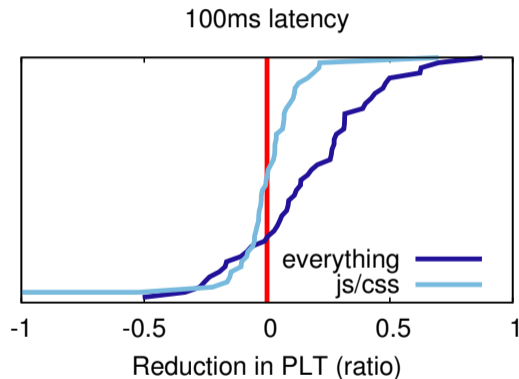

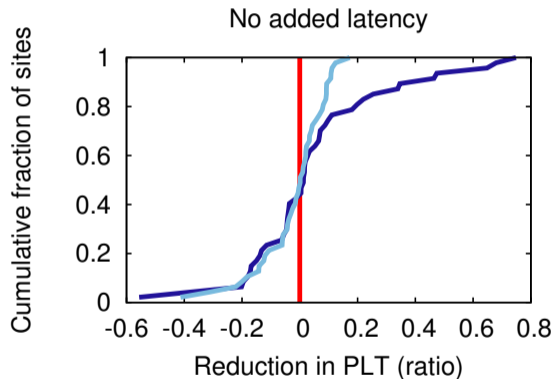

- 5 of 10,000 top sites adopted it as of last year
- Mirrored 50 sites on a local server
- Automatically load pages repeatedly and measure performance
  - Built on Chrome utilities - their definition of PLT (page load time)

# Server Push Example

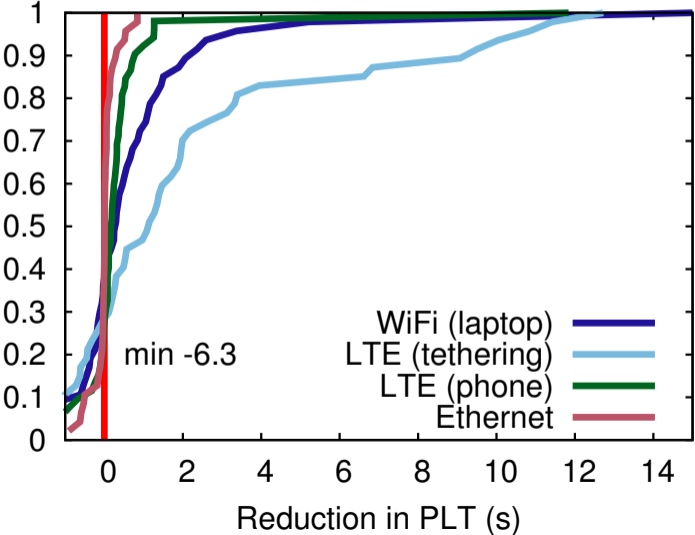

## How Much to Push

Ratio of PLT reduction to original PLT:

- Conclusion: Push everything!
- Negative values: Server Push delays the HTML object load

# Which Networks?

## Impact of latency

## Impact of bandwidth

## Impact of loss rates

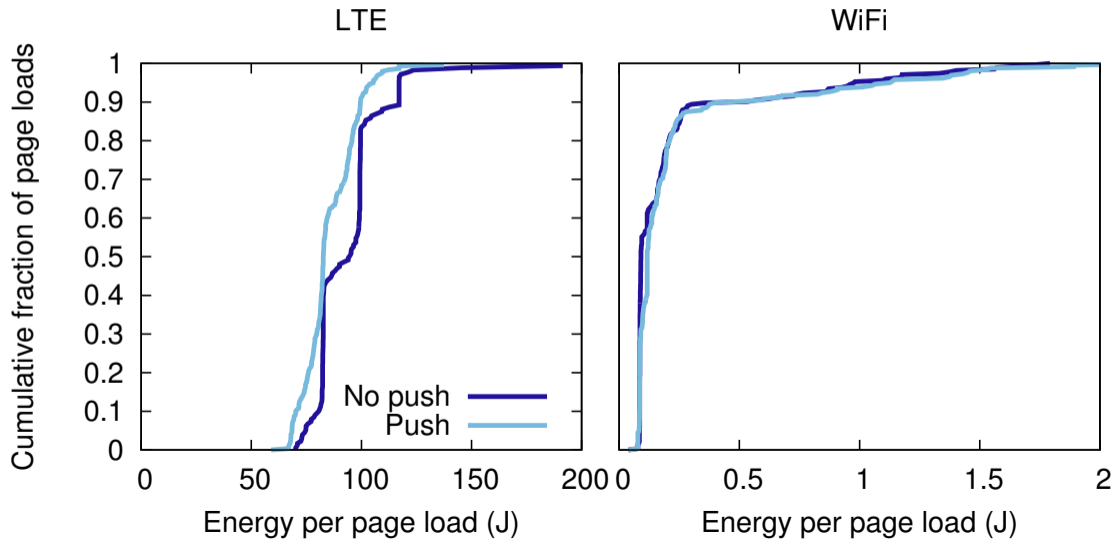

## Impact of the website

Time →

## Impact of Energy

# Conclusion

## Overall:

- Mitigates the effects of poor network conditions
- Benefits not consistent
- Most useful for cellular and wireless networks — especially as mobile devices become more powerful

## Recommendations:

- Each site should check if it benefits from Server Push
- Push as much content as possible

## Questions?

- Thanks to Yelp for sending me here!
- Yelp has a public dataset for researchers (Yelp Dataset Challenge)
